G. Research Interests

My research lies at the intersection of polymer materials engineering, surface and colloid science, and biointerface science, with three central areas of focus:

- (1) Synthesis, patterning and characterization of biomolecular, polymeric, and metallic nanostructures
- (2) Nanomechanics of polymer brushes, hydrogels, and hybrid biological/non-biological microdevices
- (3) Boundary lubrication and wear mechanisms of tissues and polymeric thin films

These broad lines of inquiry deal with fundamental behaviors of (soft-wet) materials in solution and on surfaces and interfaces. The design and fabrication of these interfaces using “smart“ polymeric and biomolecular nanostructures, and the characterization of the resulting structures, are critically important for the development of biomolecular sensors and devices and for bioinspired materials. Key approaches and tools used in my research are: scanning probe microscopies and novel shear-wave resonator devices; bottom-up organization on the molecular scale, through self-assembly, surface initiated polymerization, and manipulation of intermolecular interactions; top-down fabrication, and through scanning probe nanolithography; stimulus-responsive polymers; molecular recognition; and new approaches to sensing and manipulation. Recently we developed a versatile, enzymatic polynucleotide synthesis approach that provides easy access to a broad range of brush-functionalized polynucleotide building blocks, including DNA origami, with self-assembly properties that can yield a range of micellar morphologies in solution with potential for drug delivery applications. Energizing my interdisciplinary work are collaborations with colleagues at Duke University across a range of departments, as well as colleagues nationally and internationally.
